

YOU HAVE HOW MANY DEVICES?

WI-FI NETWORK DESIGN

WHY ARE WE HERE?

- ▶ Extremely dense client environments mean we can't wing it any longer
- ▶ Effective Wi-Fi design for high capacity is work and knowledge intensive
- ▶ It can be tough to know where to begin

WHY ARE WE HERE?

- ▶ Extremely dense client environments mean we can't wing it any longer
- ▶ Effective Wi-Fi design for high capacity is work and knowledge intensive
- ▶ It can be tough to know where to begin

ELEMENTS OF WI-FI NETWORK DESIGN

- ▶ Customer/organization requirements
- ▶ Understanding your site
- ▶ Infrastructure requirements
- ▶ Radio frequency (RF) planning
- ▶ Capacity planning

ELEMENTS OF A WI-FI NETWORK DESIGN

- ▶ Design techniques and tools
- ▶ Network installation
- ▶ Testing, validation, and adjustment

WI-FI DESIGN ELEMENTS

**CUSTOMER/ORGANIZATION
REQUIREMENTS**

A MODERN DENSE 5 GHZ NETWORK
REQUIRES MORE EQUIPMENT THAN
AN OLDER 2.4 GHZ NETWORK

BUDGET

CLIENT DEVICES

- ▶ Different Wi-Fi clients perform differently.
 - ▶ Chipsets
 - ▶ Antennas
 - ▶ Transmit power
- ▶ Document the capabilities of your fleet in order better understand implications for coverage and capacity.

CLIENT DEVICES

- ▶ Apple equipment specs usually omit detailed Wi-Fi specifications, but Apple has begun publishing more information in
 - ▶ [OS X Deployment Reference](#)
 - ▶ [iOS Deployment Reference](#)
- ▶ Also see Mike Albano's client specs project

APPLICATION REQUIREMENTS

Application	Required Throughput
Web Browsing	500 Kbps - 1 Mbps
SD Video Streaming	1 - 1.5 Mbps
AppleTV Streaming	2.5 - 8 Mbps

From the [Aerohive High Density Design Guide](#)

DENSITY

- ▶ How many devices are your users carrying?
- ▶ How many devices will be used concurrently in a given area?

FACILITY SIZE

- ▶ Facility size can provide a starting point for estimating the equipment required
- ▶ Ceiling heights affect coverage and signal intensity at clients
- ▶ Multiple floor facilities require special care to avoid channel overlap issues

CONSTRUCTION AND OBSTACLES

- ▶ Look for concrete, rebar, and elevator shafts
- ▶ Watch out for heavy metal objects, or liquids
- ▶ Attenuation of signal is documented/assumed for common materials, but verify yourself

WI-FI NETWORK DESIGN

EQUIPMENT AND INFRASTRUCTURE

EQUIPMENT AND
INFRASTRUCTURE

CABLING

NETWORK CABLING

- ▶ Sufficient cabling to appropriate locations
- ▶ Cabling according to specifications

POWER

- ▶ Access points require power
- ▶ Access points often go in hard to reach places
- ▶ Enter Power over Ethernet (PoE)

POWER OVER ETHERNET

	802.3af	802.3at
Nickname	PoE	PoE+ (plus)
Wattage/port	15.4W	34.2W
Wattage/ guaranteed	12.95W	25.5W

POE BUDGET

- ▶ ZyXel GS-1900-8
 - ▶ 8 ports
 - ▶ 802.3af/802.3at
 - ▶ 70W power budget

POE BUDGET

- ▶ ZyXel GS-1900-8
 - ▶ 8 ports
 - ▶ 802.3af/802.3at
 - ▶ 70W power budget
- ▶ How many APs is that?
 - ▶ 2 at 25.4W
 - ▶ 5 at 12.95W

POE BUDGET

<div><div><div>Power</div><div>Power over Ethernet: 37 - 57 V (802.3at required with functionality-restricted 802.3af mode supported)</div><div>Alternative 12 V DC input</div><div>Power consumption: 20W max (802.3at)</div><div>Power over Ethernet injector and DC adapter sold separately</div></div><div><div>POWER DRAW</div><div><div>PoE-Powered<ul style="list-style-type: none">Idle: 4WTypical: 5.95WPeak: 10.5W</div><div>12VDC-Powered<ul style="list-style-type: none">Idle: 4WTypical: 6.13WPeak: 11.1W</div></div></div></div>	
<div><div>POWER</div><div><ul style="list-style-type: none">48 volts DC 802.3af power over Ethernet (PoE)12 volts DC for external AC supplied power (adapter sold separately)Maximum power consumption: 12.5 watts</div></div>

Network Details

Signal Strength

Advanced Details

PLANNING GOAL

- ▶ Plan channels to minimize co-channel interference (CCI) and avoid adjacent channel interference (ACI)

CO-CHANNEL INTERFERENCE

CO-CHAUCER WHAT?

ADJACENT CHANNEL INTERFERENCE

ADJACENT CHEESESTEAK WHO?

2.4 GHZ

- ▶ 3 non-overlapping 20 MHz channels (in North America)

1, 6, 11

- ▶ Effective longer range than 5 GHz, but lower overall performance

2.4 GHZ RECOMMENDATIONS

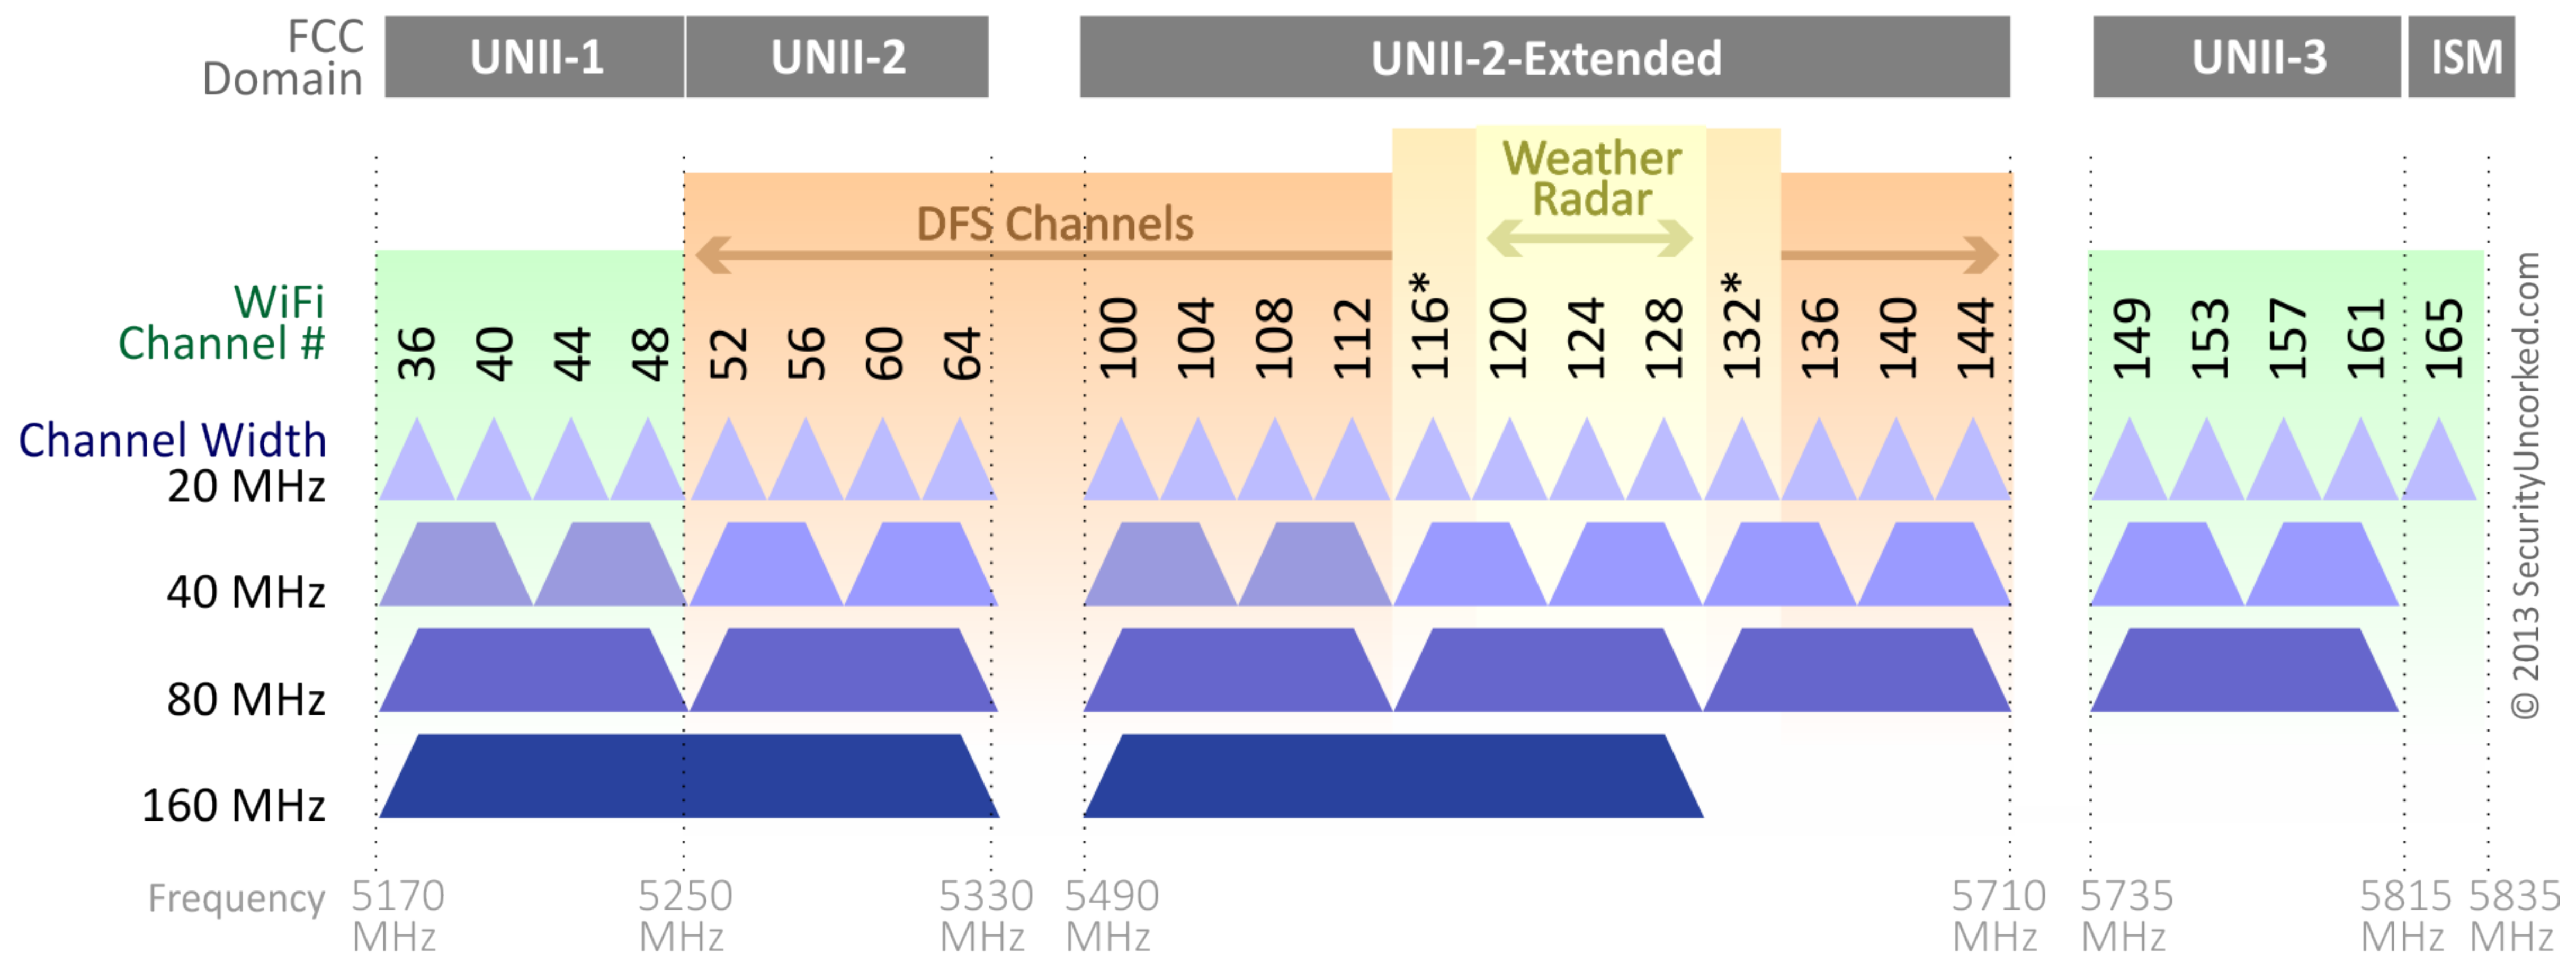

- ▶ Consider doing away with 2.4 GHz entirely, per Apple and Cisco (if you can)
- ▶ Focus your planning on achieving complete 5 GHz coverage
- ▶ If you can't get away with ditching 2.4 GHz entirely, disable 2.4 GHz radios in some of your APs in order to reduce the likelihood of overlap and resulting CCI.

5 GHZ

- ▶ 9 x 20 MHz channels
- ▶ 15 x 20 MHz DFS channels that you may be able to use
- ▶ Options for wider channels to increase performance
- ▶ Channels do not overlap!

5 GHZ CHANNELS

802.11ac Channel Allocation (N America)

*Channels 116 and 132 are Doppler Radar channels that may be used in some cases.

5 GHZ ATTENUATION

- ▶ 5 GHz signals suffer more from attenuation over distance, and weaken more rapidly than 2.4 GHz signals.
- ▶ Consequently, a 5 GHz design will require more APs than a 2.4 GHz design.
- ▶ 5 GHz will also allow support a greater density of APs.

RADIO FREQUENCY PLANNING

DYNAMIC FREQUENCY SELECTION

DYNAMIC FREQUENCY SELECTION

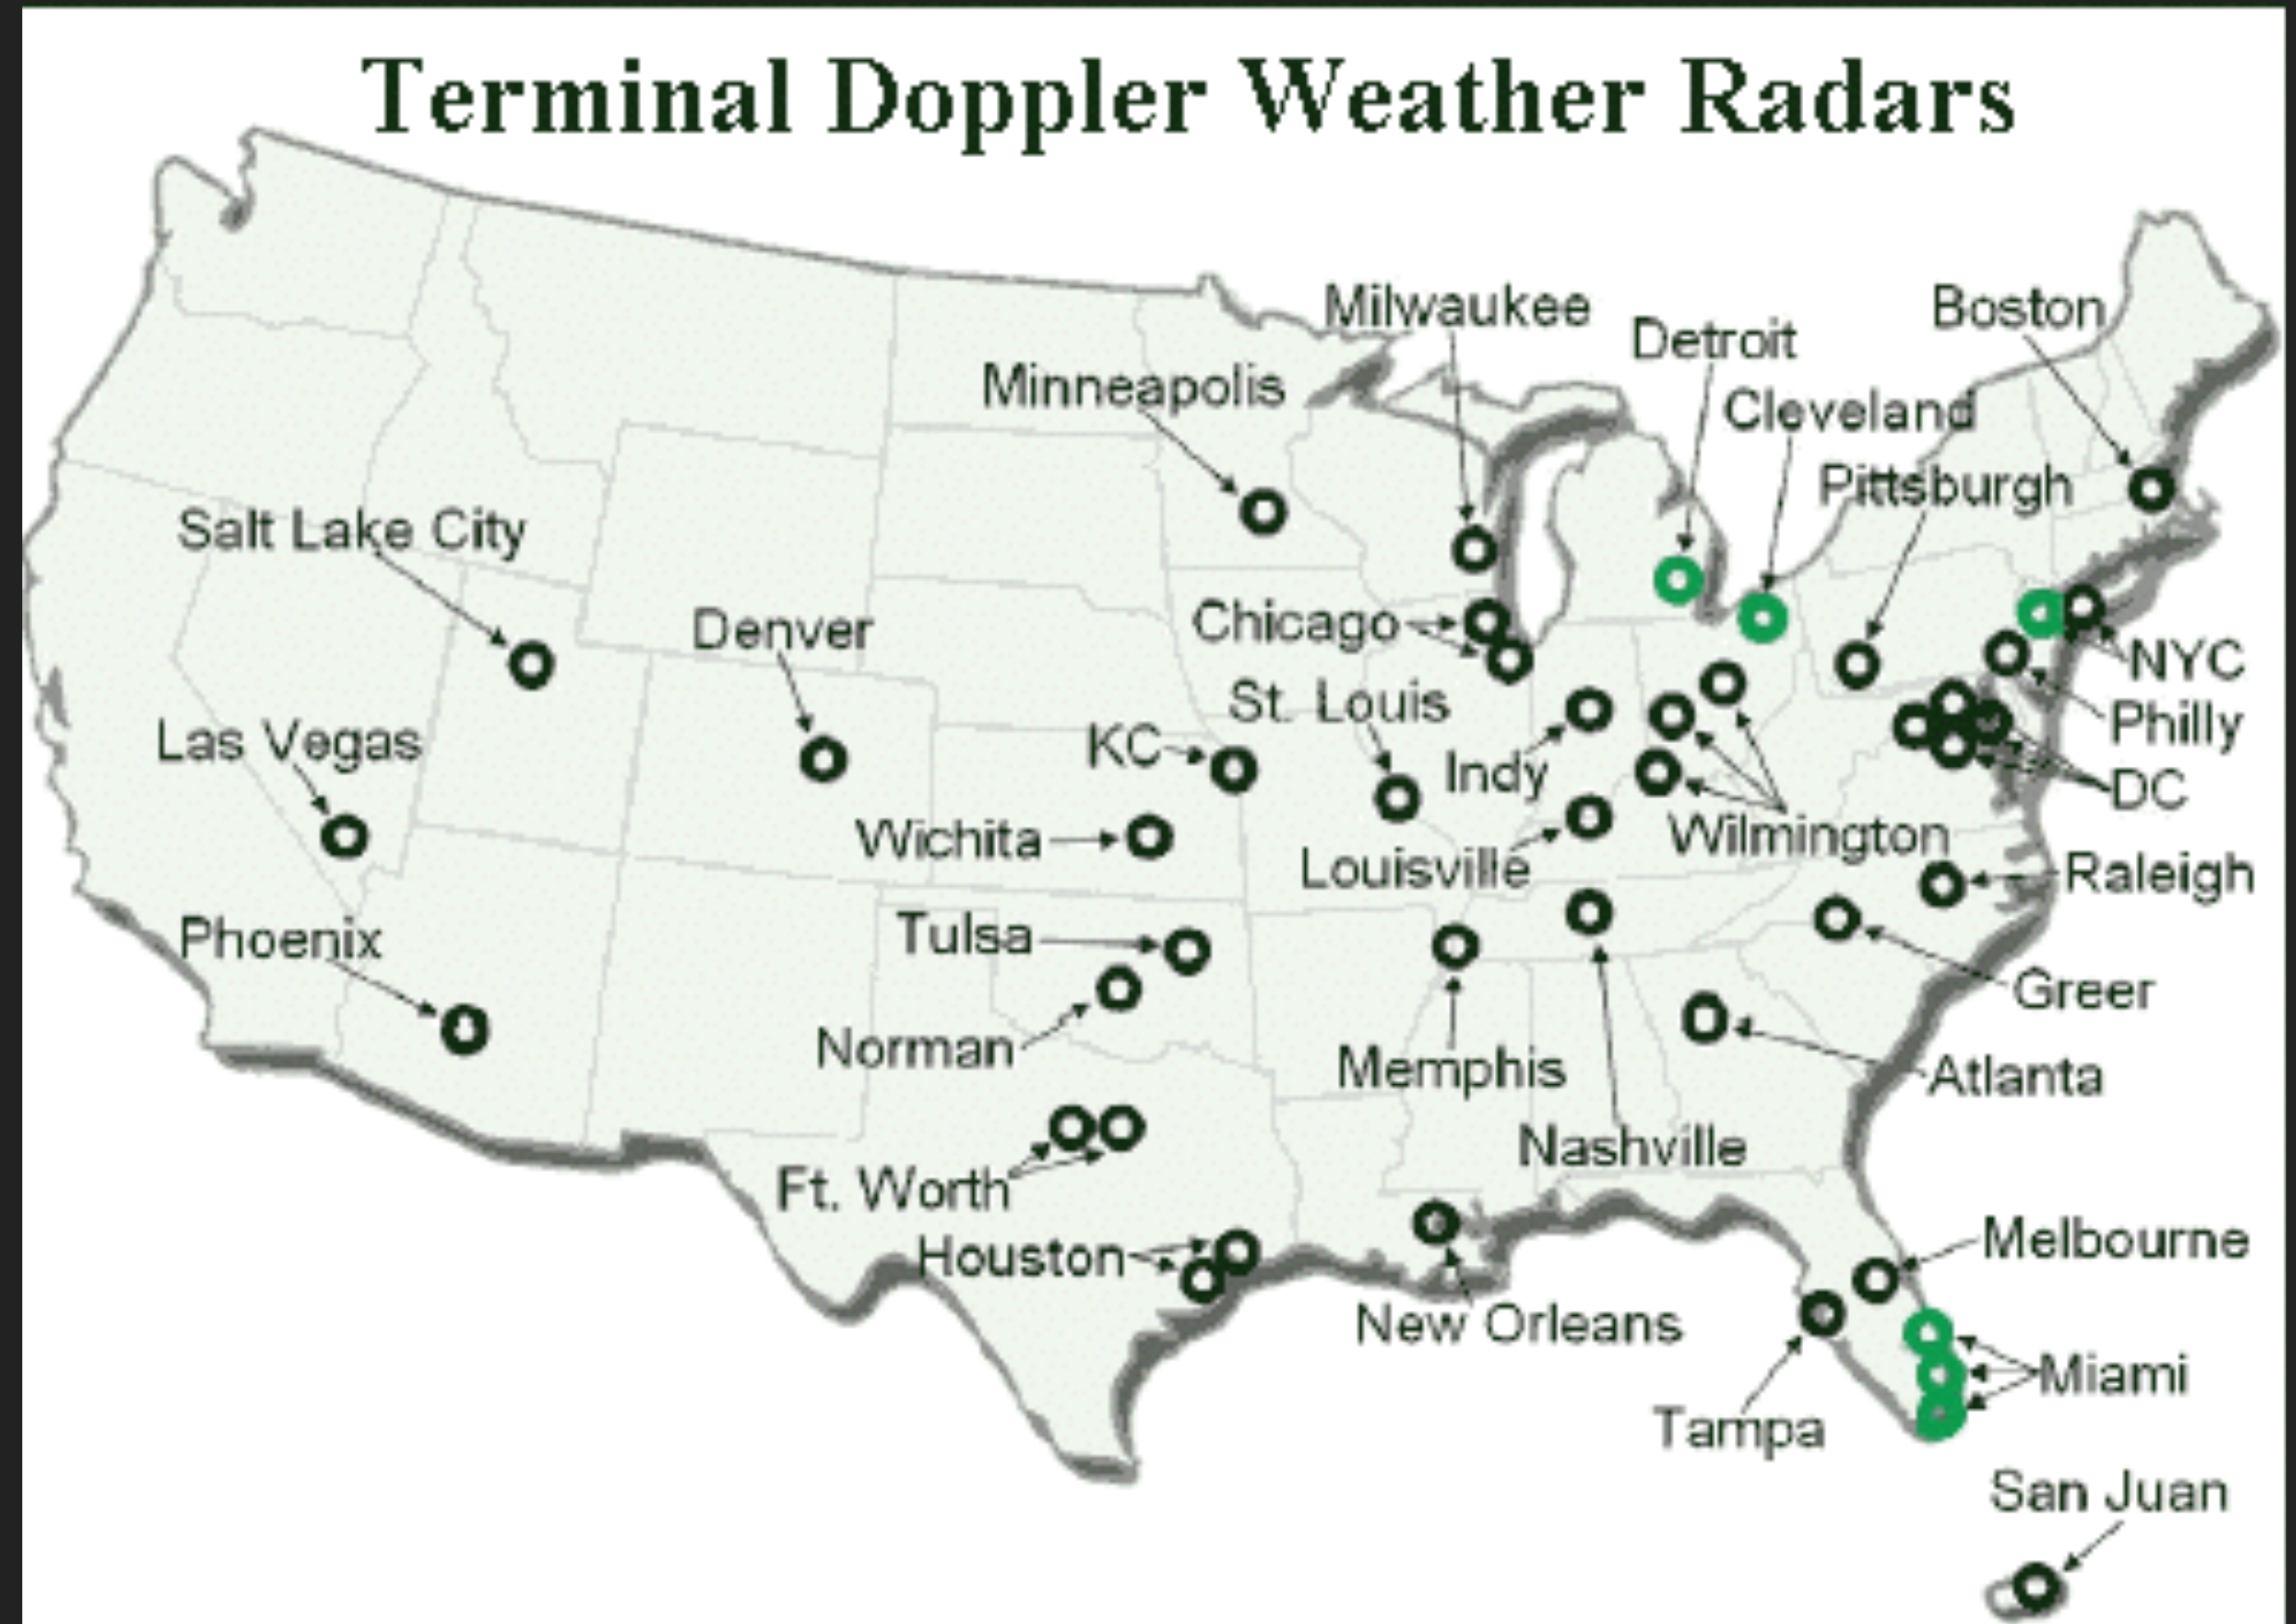

- ▶ If an access point using a DFS channel detects radar emissions, the FCC *requires* the AP to dynamically change the channel it is using.

UNII-2: 52, 56, 60 and 64

UNII-2 Extended: 100, 104, 108, 112, 116, 120, 124, 128, 132, 136, 140

5 GHZ AND TDWR

- ▶ Beyond the standard DFS channel requirements, regulations prohibit use of 120, 124, and 128 within 35 kilometers of a Terminal Doppler Weather Radar

5 GHZ AND TDWR

- ▶ The FCC is *serious*
- ▶ TDWR Interference and Enforcement records

Therefore, for the combined twelve unlawful operation and interference violations, we will propose the maximum forfeiture authorized by statute, or \$16,000 per violation, yielding a \$192,000 proposed forfeiture. In addition, for operating the unlicensed wireless broadband transceiver in Miami, we propose the base forfeiture amount of \$10,000, which is consistent with our precedent and reflects the fact that the operation of this device did not cause interference to a TDWR system.

Applying the Forfeiture Policy Statement, Section 1.80 of the Rules, and the statutory factors to the instant case, we conclude that

Towerstream is apparently liable for a total forfeiture in the amount of \$202,000, consisting of the following elements: \$106,000 for seven unlicensed operation violations and \$96,000 for six incidents of interfering with TDWR systems. As discussed above, the forfeitures reflect upward adjustments based on the public safety impact of the interference, Towerstream's prior history of causing interference to radio communications operated by the United States Government, and the seriousness of the violations.

5 GHZ CHANNELS MINUS DFS

802.11ac Channel Allocation excluding DFS (N America)

IN SUMMARY

- ▶ Design for 5 GHz
- ▶ Use 20 MHz or (maybe) 40 MHz channels
- ▶ Plan on more access points than a corresponding 2.4 GHz design
- ▶ Take advantage of DFS if you can

A dramatic low-angle shot of firefighters silhouetted against a massive fire. One firefighter is on an extended aerial ladder, directing a stream of water. Another is visible further up the ladder. A utility pole with power lines is in the foreground. The sky is filled with thick, glowing orange and yellow flames and smoke.

WI-FI NETWORK DESIGN

CAPACITY PLANNING

WAYS TO THINK ABOUT CAPACITY

- ▶ Number of APs a wireless controller can support
- ▶ Number of clients that can use an access point
- ▶ Amount of traffic an access point can move

DENSITY

- ▶ Switch environments provide performance advantages
 - ▶ Every connection is at full port speed.
 - ▶ There is a finite limit to the number of devices that can connect to a switch.

VENDOR CLAIMS ARE VARIABLE AND BEST CASE

- ▶ Ruckus says 500 per radio, or 100 when you turn on encryption
- ▶ Aerohive says 100 per radio
- ▶ Cisco Meraki classifies 40+ clients as “high-density”

CAPACITY PLANNING

10T HUB/24

ASANTÉ

Power/Traffic

BECAUSE WI-FI DEPENDS ON A SHARED MEDIUM, THINK OF AN AP MORE LIKE A HUB, BUT ONE WITHOUT PHYSICAL CONNECTION LIMITS.

DENSITY

THE WEIRD TURN PRO

AIRTIME

AIRTIME

- ▶ Calculated percentage of the available transmission time a client device will utilize to move data
- ▶ Percentage is derived from
 1. Application bandwidth requirement
 2. *Real* client performance

AIRTIME CALCULATIONS

$$\frac{\textit{Bandwidth Required}}{\textit{Real Throughput}} = \textit{Airtime Required}$$

AIRTIME CALCULATIONS: IPAD2

- ▶ SD Video: 1 Mbps
- ▶ 65 Mbps max TX = 30 Mbps real world*

*Maybe, ideally

Numbers taken from the [Aerohive High Density Design Guide](#)

AIRTIME CALCULATIONS: IPAD2

$$\frac{1 \text{ Mbps}}{30 \text{ Mbps}} = .033 \text{ or } 3.33\%$$

AIRTIME CALCULATIONS: IPAD2

- ▶ In theory, then, 30 iPad 2 would use 100% of the available Airtime on an AP
- ▶ *This is true independent of the capabilities of the access point.*
- ▶ It's also purely theoretical, and unlikely to work in practice.

AIRTIME CALCULATIONS: IPAD2

- ▶ Network collisions and congestion
- ▶ Distance from the access point
- ▶ Interference

AIRTIME

- ▶ Compare this to the faster iPad Mini 2 at 144 Mbps TX (65 Mbps expected)
- ▶ Older and less capable devices will adversely affect network capacity
- ▶ Upgrades to newer devices to mitigate
